Laboratory Code Inventory

Being right isn't enough to win — material proof of the research effort

What this document is

This inventory records, with full and verifiable honesty, the code and documents that make up the laboratory behind the book: three independent research agents —cryptocurrencies (CryptoLyrus), equities (Stock Agent) and foreign exchange (Forex, System D)— developed over months, directed by one person and written with the assistance of several artificial-intelligence models.

The count was taken on 26 October 2026 by asking each agent to classify its own material, file by file, as **CORE** (real, unique laboratory code) or **NOISE** (old versions, duplicates, auto-generated output, abandoned architectures). Only the lines of what is CORE are counted here.

> *Two figures, two different things. The «core» is the code that stayed working and is deployable. The «total effort» is everything that had to be written and modified to reach that core — mostly experiments that were tried and discarded. Both are real and measured; they are not the same thing. The core is also a floor: part of the code was lost when the server was decommissioned, so the real figure is somewhat higher, never lower.*

Summary: real laboratory code

Code classified as CORE (real, unique, de-duplicated), by agent and language. These are total lines (they include comments and blank lines); net lines are not verifiable without running the code.

Source (file count)	Python	MQL5	Other	Lines	Basis
Crypto · LLM research (5)	5,607	—	—	5,607	exact
Crypto · funding-arb bot (14)	9,397	—	—	9,397	exact
Forex · own EA & MQL5 libraries (22)	—	11,622	—	11,622	exact
Equities · Stock Agent	9,300	—	1,080	10,380	estimate
Forex · Python infra (receiver, auditor, WF)	8,360	—	490	8,850	estimate
TOTAL (sum of components)	32,664	11,622	1,570	45,856	

«exact» basis: real count, file by file (wc / Get-Content). Crypto research 5,607 = total lines of the 5 Python files (2,098 + 1,419 + 1,155 + 484 + 451); the net code, excluding embedded prompts/HTML/SQL, is 4,065. MQL5 11,622 = exact sum of the 22 own files from the MT5 listing (main EA v74 3,601 + weekly configuration bridge 1,392 + HTTP client + data downloaders…), with factory libraries and old versions removed. **«estimate» basis**: the agent's reading of its own context, ±10% margin (files not yet re-counted one by one). The total 45,856 is the arithmetic sum of the rows.

> **Core of the laboratory: 45,856 lines of working code** (32,664 Python + 11,622 MQL5 + 1,570 YAML/HTML/Bash): the code that stayed working, directed by the author and generated with artificial intelligence across three markets. Of these, **26,626 are counted one by one** (crypto + own MQL5) and 19,230 are an agent estimate pending an exact count.

> *The real effort behind that core: 285,498 lines of Python written or modified, across 815 scripts (measured on 26 Oct over the preserved code, excluding libraries). The vast majority were one-off experiments, probes and analyses that were tried, measured and discarded. That is the ratio of honest research: close to ten lines written and thrown away for every line that survived. The result is not measured by what was kept, but by everything that had to be tried in order to know what to keep.*

Raw terminal output (PowerShell), verbatim:

> Python real (última versión de cada fichero): 815 archivos, 285498 líneas

Note on authorship and method

Every file declares joint authorship in its header: the person who directed the research and the AI models that wrote the code under that direction. It is not «hand-written» code in the classical sense, and precisely for that reason it is counted for what it is: the product of a method where the machine generates and audits, and the person decides and verifies. That is, in fact, the thesis of the book.

Two honesty caveats the agents themselves flagged: (1) a large part of the raw server volume (hundreds of thousands of lines) is **not** laboratory code but old versions, program output and 2025 architectures that were abandoned; that is why only what is unique and current is counted here. (2) The laboratory code itself is not published; this inventory describes it.

Key files by agent

Crypto · CryptoLyrus — the LLM research engine

File	Lines	Role
LLM research agent (v3.4)	2,098	LLM M1 agent, latest version
LLM meta-analyzer	1,419	LLM meta-analyzer of the v4 system
Cycle experiment (v4)	1,155	Walk-forward, regime RF, Kelly
Out-of-sample validation	484	Out-of-sample, permutation, FDR
Edge validation	451	OOS 3+3m, day×hour, major coins

Equities · Stock Agent — research in US + world equities

File	Lines	Role
Paper trader (v5.2)	≈640	Final paper trader, 4% risk control
End-of-day collector (v1.2)	≈700	EOD collector via broker API, circuit breaker
Pre-market screener (v1.1)	≈520	Pre-market screener, opening gap
Scheduler (v4.1)	≈590	Multi-exchange orchestrator
World-markets agent (v1.1)	≈820	Non-US research agent (7 venues)
Daily data collector (v3)	≈640	Market-data provider collector; source of the dataset
Strategy base + strategies + registry	≈700	Strategy interface (A→J plugins)

Forex · System D — MQL5 EA + Python/Bash infrastructure

File	Lines	Role
Main EA (MQL5)	3,601	Main EA v74 + DCD filter (MQL5)
Weekly configuration bridge	1,392	Weekly configuration bridge (MQL5)
HTTP client for the EA	694	HTTP client EA↔server (MQL5)
EA signal receiver (v2.3.1)	≈1,450	Server-side receiver for the EA
Demo auditor (v1.5)	≈1,130	19-check auditor
Walk-forward runner (v7.4)	924	Walk-forward v7.4
Catastrophic monitor + kill switch	≈1,590	Emergency drawdown cut-offs

Crypto · funding-arbitrage bot — execution system

File	Lines	Role
Main bot	1,046	Main bot: scan, execute, monitor
Exchange client	1,049	Exchange client (spot + futures)
Position manager	1,007	Hedge spot/futures position ledger
ML engine	943	RandomForest+XGBoost funding ensemble
Configuration (general + per exchange)	1,355	Config, leverage, fees, circuit breakers
Kill switch	758	Multi-source emergency stop
Rate limiter + funding-time sync	1,671	Rate limits and funding synchronisation
Atomic order manager + guards	≈570	Atomic execution + liquidation guards

Laboratory verdict

Three markets researched with the same method (sealed pre-registration, power gate, real cost, out-of-sample). Dozens of hypotheses measured. The deployable result, in all three, was the same: no rule that won repeatedly after costs. This inventory is the proof that behind that conclusion there is real, measured and verifiable work — not an opinion.

> Descriptive document. Figures marked «estimate» are reading estimates (±10% margin); the exact figures come from direct counting. No figure has been rounded up. All figures come from backtests and demo accounts. Updated: 26 Oct 2026.
